

climate change

Climate change is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and which is, in addition to natural climate variability, observed over comparable time periods¹. Climate change is occurring due to human activities, in particular the large scale burning of fossil fuels for energy, which emit carbon dioxide into the atmosphere. To mitigate the effects of climate change, the international community, particularly the developed world, needs to reduce carbon dioxide emissions by transferring reliance on fossil fuels to renewable sources of energy production.

Human health is intrinsically connected to the quality of the natural environment. Humans are entirely dependent on a stable, habitable climate for food, water and comfortable living conditions. These staples of our existence are being threatened by climate change.

Nurses, midwives and assistants in nursing will be affected both professionally and personally by the effects of climate change. As the largest component of the health care workforce, they are at the forefront of providing care to communities and citizens affected by climate change. Treatment of climate change-related health conditions are adding to the burden of an already stretched health care workforce. As professions grounded in science and as providers of health care, nurses, midwives and assistants in nursing are in a position to communicate with the public and within their workplaces about climate change and health.

Nurses, midwives and assistants in nursing are well placed to develop policy and influence practices in their workplace to improve energy and water efficiency, procurement, and waste management practices.

It is the position of the Australian Nursing Federation that:

1. Urgent action needs to be taken by government and all sectors of the community to: limit potential temperature increases by reducing and limiting the release of carbon dioxide emissions from fossil fuels into the atmosphere; implement non-fossil fuel sources of energy; prepare the health sector to deal with existing and future health effects of climate change.
2. As members of the community, nurses, midwives and assistants in nursing, need to participate in the broader climate change debate, utilising their networks to communicate with politicians, the media and the community on the importance of reducing carbon emissions.
3. Research efforts must be focussed on clarifying and quantifying the negative health effects associated with climate change in order for the health sector to be able to understand and best respond to those health conditions as they arise.
4. The existing and future nursing and midwifery workforce should be educated to understand and respond to health conditions related to climate change.
5. Climate change and health related subjects must be incorporated in undergraduate and post graduate nursing and midwifery curricula.

6. Employers should:
 - Acknowledge and support nurses, midwives and assistants in nursing involved in environment and sustainability groups in their workplaces to bring about efficient and sustainable practices;
 - Support nurses, midwives and assistants in nursing to implement sound and viable climate change initiatives;
 - Showcase the efforts and successes of nurses, midwives and assistants in nursing to bring about environmentally sustainable workplace practices;
 - Ensure there is a management team tasked specifically with implementing sustainable environmental practices;
 - Ensure that health facility service delivery accreditation standards specify sustainable environmental standards for procurement, energy efficiency, water use and waste management;
 - Ensure that sustainable planning, design and construction of new health care facilities and retrofitting of existing facilities is standard practice;
 - Support health professionals in Pacific island nations to mitigate the health effects of climate change on their communities through education and formulation of policy;
 - Educate staff about climate change and implement environmentally sustainable office practices such as: using recycled office paper; using the recycling bins; setting computer printing settings to double sided, black and white printing; installing energy efficient down and fluorescent lights; turning off lights, computers, monitors and accessories when not in use; purchasing 100% green energy for office use; ensuring the air conditioning system is working efficiently; using office supplies and equipment which are produced by sustainable processes; encouraging travel to work by public transport or bicycle rather than car; investing in environmentally responsible, innovative and sustainable businesses where possible; minimising air travel by using teleconferencing; using video conferencing; carbon offsetting air travel; and, considering the investment of superannuation money in viable renewable energy projects in Australia which utilise local technology, expertise and labour resources; and
 - Endorse the principles of the World Health Organisation's 7 Elements of a Climate Friendly Hospital². These principles are: energy efficiency; green building design; alternative energy generation; transportation; food; waste; and water.
